

# Collectee — brand sheet

Every value below is read from `src/theme/theme.ts`, not sampled from a screenshot. If the app and this page disagree, the app is right and this page is stale.

## Core palette — dark (the app ships dark)

|                                                                                                            |                                                                                                               |                                                                                                              |                                                                                                          |                                                                                                               |
|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <br>background<br>#0B0D10  | <br>surface<br>#141821       | <br>border<br>#252B38       | <br>accent<br>#2F6BFF  | <br>accentMuted<br>#1B2E5C |
| <br>textPrimary<br>#FFFFFF | <br>textSecondary<br>#9AA4B5 | <br>textTertiary<br>#6B7484 | <br>success<br>#31C48D | <br>warning<br>#F5A524     |
| <br>danger<br>#F04438      | <br>accentSoft<br>#93C5FD    |                                                                                                              |                                                                                                          |                                                                                                               |

## Gradient — the one brand gradient

Used on every primary CTA, the active filter chip, the import step rail and the logo. Always **135°** (top-left → bottom-right). Do not invent a second gradient; if something needs emphasis it takes this one or it takes a flat accent.

Primary button

#3B82F6 → #9333EA

The step rail samples this ramp per segment so a run of separate views reads as one continuous sweep — see `accentRampAt()`.

## Game accents — never interchangeable

Each title owns a pair. **base** is the border or rule; **secondary** is the label colour, because **base** fails contrast on 10–12px type over a dark scrim.

| GAME                 | BASE            | SECONDARY            | WHERE IT APPEARS                               |
|----------------------|-----------------|----------------------|------------------------------------------------|
| Call of Duty: Mobile | #FF7A29 ember   | #FFB347 amber        | Game badge, news tag, hero title row           |
| Valorant             | #FF4655 red     | #22D3C5 teal         | Same. Label is teal — red fails on small type. |
| Mobile Legends       | #8B5CF6 violet  | #C4B5FD light violet | Same. Was gold; collided with CODM amber.      |
| Cross-game           | #EC4899 magenta | #F9A8D4 pink         | Communities with no single title               |

## Rarity — sort on tier, print the game's own word

Colour is the fast read; the label is the game's native term and differs per title (a CODM "Mythic" is not an MLBB "Collector"). Never invent a rarity word.

|                                                                                                         |                                                                                                        |                                                                                                        |                                                                                                              |                                                                                                            |
|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <br>common<br>#8B94A6 | <br>rare<br>#3B82F6 | <br>epic<br>#A855F7 | <br>legendary<br>#F5A524 | <br>mythic<br>#F04438 |
|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|

Type

| ROLE              | FACE              | SIZE / LINE            |
|-------------------|-------------------|------------------------|
| screenTitle       | Space Grotesk 700 | 34 / 41, -0.4          |
| overlayTitle      | Space Grotesk 700 | 23 / 28, -0.4 + shadow |
| overlayTitleSmall | Space Grotesk 700 | 20 / 25, -0.3 + shadow |
| sectionHeader     | Space Grotesk 700 | 18 / 24, -0.2          |
| cardTitle         | Inter 600         | 15 / 20                |
| body              | Inter 400         | 14 / 20                |
| meta              | Inter 500         | 12 / 16                |

Weight comes from the family, never `fontWeight`. Android synthesises a fake bold over an already-bold cut and it smears. Numbers that change live use `fontVariant: tabular-nums`.

Radius & spacing

| TOKEN       | VALUE | USE                                  |
|-------------|-------|--------------------------------------|
| radius.sm   | 8     | Inner chips, small tiles             |
| radius.card | 14    | <b>Every card.</b> The house radius. |
| radius.lg   | 20    | Sheets, large panels                 |
| radius.pill | 999   | Buttons, chips, badges, avatars      |

spacing — 4 / 8 / 12 / 16 / 24 / 32 (xs → xxl)

card: 14px radius, #141821 on #0B0D10, 1px #252B38 border

## Shadows & glow

| NAME        | SPEC                                                                     | USE                                                |
|-------------|--------------------------------------------------------------------------|----------------------------------------------------|
| accentGlow  | colour #9333EA , opacity .55, radius 16, offset 0/4                      | Gradient CTAs, the active step circle              |
| rarity lift | shadow tinted to the rarity colour, opacity .45, radius scales with tier | Epic and above only — a wall of commons stays calm |
| hover lift  | translateY -3px, 140ms                                                   | Cards in a grid. Translate only, never scale.      |
| hover pop   | spring to scale 1.06 + translateY -2 (friction 9, tension 90)            | Chips and pill CTAs — things with room around them |

The two hovers are not interchangeable. A card in a wrapped grid that scales overlaps its neighbours and pushes its border outside the container; a chip in a spaced row has room, and a 3px lift on it is invisible.

## Overlay treatment — how text sits on artwork

Cards do not put labels in a panel below the art. The art fills the tile and the text is laid over a bottom-weighted scrim, so the card spends its height once instead of twice.

- **Scrim:** a real linear gradient, `clear → medium → heavy` at stops 0 / 0.45 / 1, covering the bottom 52–62%.
- **Corner marks:** game badge top-left, owner or attribution top-right — the two frame the art between them.
- **Bottom band:** title left, counts right. Likes are `#F04438` ; item counts are white at 75%.
- **Never** place white text on raw artwork. The scrim is what makes it legible on a bright crop.

## Icon treatment

- Tab icons are **drawn line icons**, 23–24px, not an icon font. Active takes the accent; inactive takes `#6B7484` .
- The **Import** action is the exception: a filled gradient disc, raised, with a spring hover. It is the app's one primary action and looks like it.
- Badges (rarity, trust, game) are **pill-shaped, 1px border, transparent fill** — the colour lives on the border and the label, never as a solid block over artwork.

## Logo rules

- **Clear space** — at least 20% of the mark's width on every side. It is drawn with its own margin; the files in `animation/logo/` are trimmed, so add it back.
- **Minimum size** — 24px. Below that the three cards merge and it reads as a blob; use a single card if you need smaller.
- **Backgrounds** — near-black `#0B0D10` is the intended home. On light backgrounds use `collectee-mark-on-light.png`; the glow disappears on white if you use the transparent version.
- **The glow is part of the mark.** Do not flatten it away or add a second one.
- **Do not** recolour it. The blue→violet is the brand gradient; a game-accent version would claim a partnership we do not have.
- **Do not** rotate, skew or outline it.
- **Do not** place it on artwork without a scrim behind it.
- **In the app** it is a home button, 40px, sitting on the screen title's line — it is a lockup with the words, not a badge in the corner.

Generated for the Collectee motion handoff. Source of truth: `src/theme/theme.ts`, `src/config/artRegistry.ts`. Art is original prototype work — no publisher assets (§15).
